

9527AB / 9529AB

Lead Free Brass ON/OFF Terminal Balancing Valve

Feature

- Lead free brass ON/OFF terminal balancing valve
- Threaded F/F (ASME B1.20.1 - NPT) or solder joint ends (ASME B16.22)
- Tolerance on nominal Cv for fully open valve $\pm 10\%$ (test according to BS7350)
- Available on following versions:
 - Fig. 9527AB, threaded ends
 - Fig. 9529AB, solder joint ends
- Provided with mounted test points
- With threaded M30x1.5 connection for linear actuator
- 300WOG (max 300psi up to 160°F, max 150psi at 260°F)
- Working conditions:
 - Water: from 15°F to 260°F
 - below 32°F only for water with added antifreezing fluids
 - over 212°F only for water with added anti-boiling fluids

AB1953, NSF/ANSI 61 & 372 certified

$$Q = C_v \cdot \sqrt{\Delta p^{TP}}$$

The 2" valve has a stroke of one and a half turns. The regulating value on the half turn is equal to that indicated by the arrow + 10 (see picture below).

Formula linking flow Q (in GPM) and Δp measured at test points (in psi). Cv depends on regulating position as indicated on table.

Minimum flow that can be measured for each diameter may be calculated by using in the formula minimum Δp that can be measured by used manometer.

Valves are anyway designed for best performances when used on range previously suggested and as indicated by BS7350.

$$\Delta p = \left(\frac{Q}{C_v} \right)^2$$

Formula linking flow Q (in GPM) and Δp measured at test points (in psi). Cv depends on regulating position as indicated on table.

Installation

Regulation is done by removing the ON/OFF cap and acting on regulation indicator with the provided regulating key, for sizes 1 1/4" and larger the key is attached to the ON/OFF cap. Once desired regulation is obtained screw on the cap (gently with the only aim to fix it to the valve, do not apply force!).

It's possible at any time to act on the ON/OFF cap to completely close the valve, independently from regulation. To do so act on the cap screwing it on at full stroke.

To obtain the best performances valve must be installed on a pipe with its same nominal size preceded and followed by straight pipe lengths as per figure indications.

9527AB / 9529AB

Lead Free Brass ON/OFF Terminal Balancing Valve

It is possible, at any time and even after the installation of the valve onto the line, to install onto the 9520 valve series a linear Vaurien actuator (for more information please refer to its specific technical sheet).

Remove the ON/OFF cap and fix the adaptor onto the valve (making sure you select the appropriate one for the valve diameter as per figure below), tighten by hand in a clock-wise direction thus avoiding the use of any additional tools.

For valves up to 1" (included) fix the actuator onto the adaptor by simply pressing the two parts together. Should it be necessary to remove the actuator, for example to set a new regulation on the graduated scale, press the unblock button and simply pull the actuator off without unscrewing the adaptor from the valve.

For valves 1¼" and larger screw the actuator on the adaptor. Simply unscrew it if in need to remove it.

Presetting

By using the diagram above, it is possible to evaluate the presetting position of the valve with given design flowrate and headloss:

- 1) draw a straight line joining design flowrate and design headloss;
- 2) determine design Cv value as intersection of drawn line and Cv axis;
- 3) draw a straight horizontal line from intersection previously identified and the specific valve DN Axis;
- 4) intersection determines handwheel position to use for presetting.

In the example for a design flowrate of 4GPM and design Δp 3psi handwheel position of a 1/2" valve
